ABSTRACT
Herbal medicine industry in Indonesia was shaken when Indonesian National Agency of Drugs and Food control prohibits the development of herbal medicines made from Catharanthus roseus. The reason given is that Catharanthus roseus contains alkaloids causing bone marrow depression. The purpose of this article is to examine the effects of both preclinical and clinical pharmacological of Catharanthus roseus. The result of the research shows Catharanthus roseus have many pharmacological effects include: antidiabetic, hypolipidemic, antihypertension, anticancer, antiangiogenesis, antispermatogenic, antifungal, antibacterial, antioxidant, wound healing and even hepatoprotective activity.

Keywords: Catharanthus roseus, Herbal medicine, Pharmacological, Alkaloid, Bone suppression

INTRODUCTION
Indonesian National Agency of Drugs and Food Control released regulation no. 10 of 2014 that prohibit the development (manufacture & distribute) of herbal medicines / supplements made from Catharanthus roseus. This raises questions and allegations as to be Catharanthus roseus is a dangerous plant. The regulation stated that the alkaloids in Catharanthus roseus may cause bone marrow depression. Interestingly, many studies suggest a variety of pharmacological effects of Catharanthus roseus. Most studies are still in the preclinical stage study, but some others already in early stages of clinical trials. Vincristine and Vinblastin of Catharanthus roseus even been marketed. The prohibition should not be necessary if the development of herbal medicines made from Catharanthus roseus can eliminate the presence of alkaloids. This review tries to investigate pharmacological effects of Catharanthus roseus.

Description
Catharanthus roseus is tropical/subtropical plant that is spread throughout the world. This plant belongs to the family of Apocynaceae. This plant is herbaceous/ sub herbaceous with a high CMM 40-80. The flower color are purple and pink white. It has different names in several countries, among others: Tapak dara (Indonesia), Kemuning china (Malaysia), Periwinkle (Madagascar), Nuyantara (Bangladesh), Ainskati, Niyakalyani, Rattanot, Sadaphal, Usahanamai (India), Kantotan (Filipina), Nicchinch-so (Jepang), Chatilla (Guatemala), Phaeng phoi farang (Thailand), etc.

Traditional Uses
Leaves of Catharanthus roseus is commonly used as antidiabetic in Northern Europe (Swanson-Platt) and India. In Brazil, Dominica, England, Cook Islands, Jamaica, Mozambique, Pakistan, Taiwan, Thailand and West Indies, decoction of Catharanthus roseus leaves are also used as antidiabetic. In India this plant was used to treat depression, muscle pain, bleeding gums, mouth, ulcers and sore throats. This plant was also used to treat cystitis, gastritis, hypertension, enteritis, diarrhoea. In South Africa, people use Catharanthus roseus as urogenital infection, diabetes mellitus (Zulu people), menstruagia and rheumatism. In Southern and Eastern Africa, this plant was used to treat unspecified venereal diseases. The people of Mutirikwi, Zimbabwe, used Catharanthus roseus to treat stomach ache. The decoction of leaves of Catharanthus roseus were used to treat diabetes mellitus (In the Kancheepuram, a District of Tamil Nadu, India).

Preclinical studies of pharmacological properties
Antidiabetic
The ethanolic extract of Catharanthus roseus leaves & flower reduced blood glucose level in diabetic rats. The combination of dichloromethane : methanol extract with ratio 1:1 dosage 500mg/kg bw orally for 7 days and 15 days reduced blood glucose level with hypoglycemic activity 48.6 and 57.6% in streptozotocin induced diabetic rats. Catharanthus roseus leaf powder suspension in 2 ml distilled water (100 mg/kg body weight/day/60 days) orally can reduced plasma glucose and increase plasma insulin in diabetic rat induced by streptozotocin. The aqueous extract of Catharanthus roseus leaves dose 1g/kg bw can reduced blood glucose level significantly as compared to control (28.20±0.34 vs 32.99±0.89 m mol/L). The aqueous extract of Catharanthus roseus leaves, roots, flower and stem at doses 250mg/kg bw intra peritoneal for 14 days can reduced blood glucose level and the reduction percentage is 52.90%. The combination of...
The antifungal effect. Penicillium flavus, Aspergillus fumigates, Candida albicans of percentage of motile sperm less than control. Antispermatogenic decrease leaves (TC, TG, LDL & VLDL) significantly. Catharanthus roseus total vindolinine, leurosine, lochnerine, tetrahydroalst reduction on roseus significantly. Fastening blood glucose 25% of diabetic level in 500mg/kg bw orally for 14 days Catharanthus roseus percentage of 16, 18, 20 & 24 h respectively. Secondary metabolites such as alkaloids in Catharanthus roseus were suspected causing antifungal effect.

Anticancer and cytotoxic
The chloroform extracts of crude of Catharanthus roseus has cytotoxic activity to human colorectal carcinoma cell line (HCT 116). Vindolin and catharantine are two isolated compound from Catharanthus roseus which has cytotoxic activity to HCT 116. The cytotoxic activity of catharantine was greater than vindolin. Catharantine has cytotoxic activity to HCT 116 with IC_{50} 60µg/mL.

Vincaleukoblastine derivative from alkaloid vinea has antineoplastic activity in mice, was transplanted by leukemia L1210, P1534 and Ehrlich ascites tumor cells, while vincristine has antineoplastic effect on patients with Hodgkin’s disease. 39% patients with Hodgkin’s disease treated by vincristine have temporary remission more than one month. The mechanism involved were binding of this agent to tubulin. This binding could block the mitosis cell that causes metaphase capture.

Antibacterial
The 10, 25, 50, 75 and 100 mg of the dried whole plant extracts with dichloromethane: methanol (1:1) have antibacterial activity to K. pneumoniae, P. aeruginosa, E. coli, B. cereus, B. subtilis, and S. aureus. Research by Balaabirami et al., 2012 found that the ethanolic extract of Catharanthus roseus leaves has antibacterial effect to Escherichia coli, Klebsiella oxytoca, Proteus mirabilis, Pseudomonas aeruginosa, Salmonella typhimurium, Salomonella paratyphi and Staphylococcus aureus.

Hepatoprotective
The ethanolic extract of Catharanthus roseus leaves at dose of 500 mg/kgbw reduced blood SGOT and SGPT level in rats. This effect may be due to antioxidant property of phenolic compound from this extract.

Antioxidant
The methanolic extract of Catharanthus roseus val. Alba leaves at doses of 200 &400 mg/kgbw have antioxidant effect. This extract reduced plasma superoxide dismutase, catalase and glutathione levels significantly of diabetic rats as compared to controls.

Wound healing activity
The ethanolic extract of Catharanthus roseus flower 100mg/kgbw/day orally for 10 days showed wound healing activity in wound model rats SD strain. This extract increased the wound breaking strength in the incision wound and decreased wound area and epithelization period in excision wound compared with controls (P < 0.001). Research by Dewi et al., 2013 found that the methanol leaf extract of Catharanthus roseus 15% topically increases wound healing/epithelization in wistar rats.

Antiangiogenesis
Several plants of traditional Chinese medicinal herb have anti-angiogenesis effect on chick embryo chorioallantoic membrane model. The aqueous extract of Catharanthus roseus leaves at dose of 1g herb/mL has anti-angiogenesis activity with percentage of inhibition is (33.65 ± 1.62%).
Clinical studies of pharmacological properties

Anticancer

Vincristine sulfate is indicated to treat lymphoblastic leukemia acute and lymphoma. This agent was approved by US FDA in 1963 with brand name Oncovin®. Vinblastine is indicated to treat lymphomas inclusive of Hodgkin’s disease, bladder and breast cancers. In 1965, Vinblastine sulfate was approved by FDA. This agent was marketed with brand name (Velban®).

Vindesine and Vinorelbine, a semisynthetic derivate of vinblastine have potency to treat hematologic malignancy. Vindesine (Eldisine®) is used in France, the UK, and other countries to treat drug-resistant acute of lymphoid leukemia, while vinorelbine shows potency to treat Hodgkin’s disease. Vinorelbine tartrate (Navelbine®) is used to treat non-small cell lung carcinoma or advanced breast cancer.

Antidiabetic

In a clinical study involved 60 people suffered from diabetic mellitus, the administration of the aqueous extract of Catharanthus roseus at dose of 75mg/day for 30 days can reduce blood glucose level 2 h post prandial, glycated Hb, Total Cholesterol, Total Triglyceride, LDL-C, VLDL-C, HDL-C significantly as compared to control (placebo).

Circulatory disorder

Ajmalicine, alkaloid from Catharanthus roseus, is used for treatment circulatory disease. The monomeric alkaloids ajmalicine and serpentine are used in the treatment of circulatory diseases.

Chemical compounds

Catharanthus roseus contains about 130 different alkaloids. The several alkaloid among others: reserpine, ajmalicine, vinceine, raubasin, catharine and vindoline. Anticancer drugs are vincristine & vinblastine, cartharathine, lochneinine, vindoline, vindolinenine, tetrahydroalstronine, reserpine, serpentine. Vincristine is indicated to treat Hodgkin’s Lymphoma, while vinblastine revealed to treat leukemia on child.

The Phytoconstituents of Catharanthus roseus are carbohydrate, alkaloid, glycoside, flavonoids, tannin, saponin, protein, amino acid, fats and oils. Fraction of petroleum ether of ethanolic of C. roseus leaves contains tannin, alkaloid, flavonoid. While fraction of chloroform & ethyl acetate contains alkaloid and flavonoid.

The development of herbal medicine industry in Indonesia continues to increase. In 2002 recorded only 29 small traditional medicine industry. This number increased to 172 in 2006. The complete list can be seen in Table 1

Table 1: Herbal Medicine industry profile in Indonesia.

Research by the Agency for Health Research and Development of Ministry of Health in 2007 on the use of herbal medicine by the people of Indonesia showed that 35.7% of people use herbs and more than 85% of them admitted the beneficial herbs for health. In 2010 research was repeated and the result were 59.12% and 95.6% people admitted the beneficial herbs for health.

Only 32 herbal medicine industries in Indonesia have been following good manufacturing practices for herbal medicine. The majority of herbal medicine in Indonesia are not concerned with the alkaloids content of Catharanthus roseus that might cause bone marrow depression. This possibly underlies the prohibition of this herb production by Indonesia National agency of Food and Drugs Control.

CONCLUSION

Catharanthus roseus has many pharmacological effects. The prohibition of the development of herbal medicines made from Catharanthus roseus due to its alkaloids contents could be avoided if the industry can eliminate these alkaloids. Within certain limits this rule can be understood as the practical level. Most Indonesian herbal medicine industries are small and medium industries which are sometimes less concern with the risk of alkaloids resulted from the Catharanthus roseus.

THE PROFILE OF HERBAL MEDICINE INDUSTRY IN INDONESIA

Indonesia is a tropical country and known as having second largest biodiversity after Brazil. It is estimated that there are around 25000-30000 plants found in Indonesia. This quantity is about 80% of the total plants in the world and 90% of the population of plants in Asia. It is estimated that 7000 species of plants are utilized by Indonesian people as a traditional medicine and about 283 species of medicinal herbs are used by industry and registered to Indonesia National Agency of Drugs and Food Control.
