ABSTRACT

Inula racemosa Hook. F (Asteraceae) commonly known as Pushkaramula is a well documented Indian medicinal plant. Pushkarmula is one of the herbs mentioned in all Ayurvedic scriptures. It possesses various synonyms like kasari- an enemy of cough, sulahara - pain killer, sugandhika - fragrant etc. The great sage Charaka has categorized it as hikkangarahana – stops hiccup and svasahara – alleviates the breathlessness, asthma. It is also best medicament for pleurisy along with cough and asthma. Pushkarmula is highly acclaimed to be the drug of choice for pleurisy (parsvasula). It has also anti-inflammatory, cardiovascular, hypoglycemic, antianginal, analgesic and antibacterial properties. Many of these ethnomedical properties have been experimentally proven in different animal models. This article is an attempt to collect and review all the data concerning systemic scientific study of ethnopharmacology of Inula racemosa, its isolated phytoconstituents and bioactivity of extracts as well as isolated compounds from the plant.

Keywords: Inula racemosa, ethnopharmacology, phytochemistry, bioactivity.

INTRODUCTION

The plant, Inula racemosa is abundantly found in India, China and Europe. The plant grows in temperate and alpine Western Himalayas from 1300 to 4500 meters elevation. The plant is distributed in temperate alpine Himalayas at an altitude of 1,500-4,200m from Kashmir to Kumaon, Afghanistan to Central Nepal. It occurs wild among strong alpine scrub vegetation in the cold arid habitat of NW Himalayas between 2,700-3,500 m in the eastern Ladakh (Leh) region of Kashmir.

Domesticated forms of this incipient cultigen are cultivated on borders of agricultural fields of wheat, barley and buckwheat both in Kashmir and Lahaul valley of Himachal Pradesh. The plant is a stout shrub, bearing large leaves arranged in a racemose manner. The stem is grooved and all vegetative parts are scabridtomentose. Lower leaves are narrowed to a winged leaf stack. Upper leaves are lanceolate and stem clasping. The abaxiallinal face is densely tomentose

Inula racemosa is known to be used in traditional medicine throughout the world, especially East Asia and Europe. Apart from being used for other ailments, the plant extract and its isolated active constituents show promising activity against abdominal pain, acute enteritis, bacillary dysentery, expectorant and tonic. Inula racemosa is also used in combination with other plant extracts and used for various conditions including hyperlipidemia, angina and patients with Ischemic Heart Disease. Various active constituents have been isolated from the plant, most important being sesquiterpene lactones-Alantolactone (ALT), and isoalantolactone (IALT) that show anti-inflammatory and decreased proteolytic activity. This review is therefore aimed to comprehensively collect all the literature regarding ethnopharmacology, phytoconstituents, and biological activity of Inula racemosa.

Etnopharmacology

Inula racemosa has been used as traditional medicine in East Asia and Europe. In China it has been prescribed for abdominal pain, acute enteritis and bacillary dysentery. The roots are widely used as indigenous medicine, as an expectorant and in veterinary medicine as a tonic. Native Americans use this plant for treatment of tuberculosis. Root powder is reportedly hypoglycemic and hypcholesterolemic in human subjects. It brought about a beneficial improvement in ST-T changes in ECG of patients with Ischemic heart disease (IHD).

Combination therapy of Inula racemosa with other plants and extracts has also shown substantial biological activities. It is anti-anginal and hypolipidemic when used in combination with guggulu in patients with Ischemic heart disease. It exerts cardioprotective effect in isoproterenol induced myocardial ischemia in rats when used in combination with drugs

The drug exhibited negative chronotropic effect and positive inotropic effect on isolated frog heart with petroleum ether extract(200mg/kg).Further, increase of dose to 400mg/kg exhibited adrenaline-induced beta blocking activity in rats. Petroleum ether extract exhibited less hepatoprotective activity
as compared to the aqueous, methanolic and total aqueous extract. Moreover, with the alcoholic extract significant protection against egg albumin induced passive cutaneous anaphylaxis was provided and the alcoholic extract is non-toxic up to 2100±60mg/kg i.p in rats. Furthermore, anti-dermatophytic and anti-cholinergic activities were exhibited by the crude alcoholic extract, the former reportedly localized in the hexane soluble fraction.

Isolated phytochemical constituents from *Inula racemosa*

*Inula racemosa* yields large amounts of sesquiterpene lactones as-Alantolactone (ALT) and isoalantolactone (IALT); Dihydroalantolactone, dihydroisoalantolactone, inunolide, dihydroinunolide, neoolantolactone, isooalantolactone; alloalantolactone, inunolide and isoalantolide are other sesquiterpene lactones isolated from the non polar fractions of the root.

Daucosterol, D- mannitol and Beta sitosterol have also been reported in good quantities from the roots. Roots of ‘mano’ from Kashmir is reported to yield 5.7-6.2% petroleum ether extract while those from Lahaul valley, Himachal Pradesh reportedly yield 8.5%w/w constituted of 83% lactones. The major lactones ALT and IALT are in the ratio 4:6.

Investigation on the aerial parts of *Inula racemosa* reported the presence of several other sesquiterpene lactones namely ivalin acetate, 2d-OH alantolactone, 1-deoxy-8-epi-ivangustin, 8-epi-ivangustin, 9β-OH costunolide, 9 β-propionyloxycostunolide, 9 β-(2-methylbutarylxy)l costunolide, 4β-5α-epoxy-10 α, 14H-inuvisolide, 4β, 5α-epoxy-4,5-cis-inunisolide, 4H-tomentosin, 4H carbone.

Structure was identified as 1-4-epi-alantolactone(2) 4-alpha,13-dihydroxy-5,7(11)-eudesmadien-12,8-olide.Six known eudesmene-12,8-olide viz., Septuplinolide, (3) macrophyllilactone E (4); 13-acetyloxy-5,7(11)-eudesmadien-12,8-olide (5) 
11 alpha,13-dihydro-2alpaha-hydroxy-alantolactone (6) 
11,13-dihydrovalin (7) 
Isoalantolactone(8). (Figure 1)

**Fig. 1. Structures of compounds 1-8.**

Biological Activities of Isolated Compounds

“Sesquiterpene lactones are important because of their various biological activities and generic inhibition of enzymes. They provide protection to the plant against various pathogenic organisms, insects and mammals. They are secondary metabolites of plant exerting various biochemical effects on other flora and vertebrate poisoning.

The main sesquiterpene lactones found in *Inula racemosa* are ALT and IALT. A mixture containing both the lactones is called *Inula camphor* (Helenin). In antiquity *Inula helenium* (Elecampane) contains both ALT and IALT. It was added to food as a seasoning in the middle age and later, it came to be used for medicinal purposes. Now a days, this mixture is the active principle of drug Alanton which is used for ulceration.

The drug is anti-inflammatory, antiproteolytic and is used to regulate the acidic function of the stomach. Alanton also promotes mucin formation and stimulates the regenerative capacity of the gastric mucosa.

ALT and IALT promotes the growth in number of rootlets of *Phaseolus aureus* by a factor of 2-2.5 as compared to control in the experiment. IALT is herbicidal because of its lipophilicity. It gets incorporated into cell membrane and does not reach to other regions of the plant.

ALT and IALT showed an increase in the antioxidant activity of lipids at doses of 100-200 mgkg, their action considerably more than antioxidant activity of α-tocopherol and ubiquinone. The anti-tussive activity of heleinin in guinea pigs has been seen, but it is half that of codeine.

Both ALT and IALT possess antibacterial activities against many of gram positive and gram negative bacteria. ALT is completely inhibitory to *Bacillus subtilis*, while IALT exhibited weak antibacterial activity towards *Bacillus subtilis* and *Bacillus vulgaris*. ALT and helerin possessed pronounced inhibitory effect against *Staphylococcus aureus* and *Mycobacterium tuberculosis* at 31.2-62.5 and 31.22µg/ml respectively.

The antifungal activity has been studied in relation to more than 16 different cultures for both ALT and IALT, inhibited the
growth of all the fungi studied, but the effects for each individual culture differed greatly. For zoophilic fungi Microsporum cookie and Trichophyton mentagrophytes both ALT and IALT exhibited their greatest inhibitory effect\(^3\).

The antibacterial and antifungal activity of sesquiterpene lactones has been mainly due to the presence or absence of α-methylene group in the lactone ring alone\(^3\). This has been proved by the SAR of several sesquiterpene lactones.

Helienin was extracted from roots of \(\text{Inula helenium}\). It consisted of 40% alantolactone and 60% isoalantolactone\(^3\). On investigation it was seen that the cytotoxic property of Helienin was mainly due to the presence of IALT in it\(^3\). By using the model of culture of human epidermal carcinoma cells, helienin was seen to possess IALT in it\(^3\). In vitro experiments of lines of human lung carcinoma cells also confirmed the cytotoxicities of ALT and IALT in it\(^3\). LD\(_{50}\) was seen to be 4.6µg/ml for ALT and 16µg/ml for IALT. For complete suppression of growth of cells dose was 50µg/ml.

Biological activity of sesquiterpene lactones (ALT and IALT) is mainly due to the presence of reactive group –CH=C≡C=O in it. The basis of cytotoxic effect is due to Michael addition reaction between –CH=C≡C=O and the SH group of enzymes and proteins\(^4\). Lipophilicity also plays an important role in the biological activities of sesquiterpene lactones. With increase in lipophilicity cytotoxicity increases in Ivalin (2-OH alantolactone) and ivaspin (1, 2-dihydroxyalantolactone)\(^5\).

The presence of α-methylene-γ-lactone group is the reason for allergic contact dermatitis. The importance of reactivity of lactone has been shown in experiments because of interaction of ALT with various amino acids, due to which, ALT loses its immunological reactivity. Also ALT and 11, 13-dihydroalantolactone is toxic in relation to the in vitro culture of leukocytes\(^6\) (37).

**Biological Activity of Different extracts of \(\text{Inula racemosa}\)**

**Anti-Inflammatory Activity**

The anti-inflammatory activity of the ethanol extract of the roots of \(\text{Inula racemosa}\) was evaluated by carrageenan-induced paw edema in rats. Ethanol extract showed maximum inhibition (34.17\%) at a dose of 200 mg kg\(^{-1}\), body weight (b.w.) after 2 h of drug administration in carrageenan-induced paw edema. Aspirin (100 mg kg\(^{-1}\)) was used as standard drug produced 17.50\% of inhibition in paw edema\(^8\). In another study, aqueous extract of the roots of \(\text{I. racemosa}\) showed maximum inhibition (60\%) at a dose of 400 mg/kg b.w. after 8 h of drug administration in carrageenan-induced paw edema in rats, whereas standard drug indomethacin (20 mg kg\(^{-1}\)) produced 69\% of inhibition\(^9\).

**Analgesic Activity**

Analgesic effect of ethanol extract of the roots of \(\text{Inula racemosa}\) was performed in albino rats of either sex using hot plate. Ethanol extract of the plant showed latency in percentage protection (42.99\%) at a dose of 200 mg/kg, b.w. after 2 h of drug administration. Standard drug aspirin (100 mg kg\(^{-1}\)) produced 65.47\% latency of percentage protection \(^4\). Also, analgesic effect of aqueous extract of the roots of \(\text{Inula racemosa}\) was performed in albino mice of either sex by acetic acid-induced writhing and tail immersion methods. Aqueous extract of plant at a dose of 400 mg kg\(^{-1}\) showed higher latency of percentage protection (63\%), whereas in tail immersion model the highest enhanced reaction time was observed at 400 mg kg\(^{-1}\) (8.65 ± 1.63 at 3 h)\(^1\).

**Cytotoxic Activity**

In-vitro cytotoxic activity of 95% ethanol extract of \(\text{Inula racemosa}\) roots and its different fractions (n-hexane, chloroform, n-butanol and aqueous) was evaluated on colon, ovary, prostate, lung, CNS and leukemia cancer cell lines using sulphotodamine-B dye and MTT assay for HL-60 cell line. The major constituents of hexane fraction i.e. alantolactone and isoalantolactone was studied for its mode of action in HL-60 cells. The lowest IC\(_{50}\) value (10.25 µg mL\(^{-1}\)) was found for n-hexane fraction for Colo-205, a colon cancer cell line, whereas 17.86 µg mL\(^{-1}\) was the highest IC\(_{50}\) value found for CNS cancer cell line (SF-295)\(^6\). Ma et al isolated racemosalactones A, alantolactone, isoalantolactone, alloalantolactone, 5-α-epoxyalantolactone, α-epoxisoalantolactone and isoletekin from the methanol roots extract of \(\text{Inula racemosa}\). All the isolated compounds were evaluated for their antiproliferative activities using human non-small-cell lung cancer (A-549), hepatocellular carcinoma (HepG-2) and human fibrosarcoma (HT-1080) cells using CCK-8 dye. All the tested compounds exhibited antiproliferative activities with IC\(_{50}\) values ranging from 0.38 to 4.19 µg mL\(^{-1}\) against human non-small-cell lung cancer. A-549, hepatocellular carcinoma HepG-2, and human fibrosarcoma HT-1080 cells. Isolated compounds alantolactone and isoalantolactone were evaluated for antiproliferative activity against human umbilical vein endothelial cells (HUVECs). IC\(_{50}\) values for these two compounds were found to be 2.4 and 2.5 µg mL\(^{-1}\), respectively\(^4\).

Zhang et al isolated septuplinolide, 11-α,13-dihydro-2-α-hydroxy-alantolactone, 11, 13-dihydrovalin and isoalantolactone from the ethanol root extract of \(\text{Inula racemosa}\). All the isolated compounds were evaluated for their cytotoxic activities using human lung cancer (A-549), human liver cancer (BEL-7402), human stomach cancer (BGC-823), human colon cancer (HCT-8) and human ovarian cancer (A-2780) cell lines using MTT assays. All the tested compounds exhibited moderate anticancer activities\(^4\). “Macrophyllilactone E, isoalantolactone isolated from \(\text{Inula racemosa}\) was evaluated for their anti-platelet activating factor against the release of β-glucuronidase in rat’s polymorphonuclear leukocytes, whereas ginkgolate used as a positive control. For these two compounds, inhibition ratio was found to be 65.4% and 80.5% respectively, at a concentration of 10 µM whereas ginkgolate produce 68.3% inhibition\(^4\)."

The cytotoxicity of ethanol roots extract of \(\text{Inula racemosa}\) was evaluated using the SRB (Sulphorphodamine-B) and MTT assay on normal human liver cell. CTC50 value was found to be 666.14 ± 22.44, 690.14 ± 6.74 µg mL\(^{-1}\) by using MTT and SRB assay respectively in Chang liver cells (normal human liver cell)\(^4\).

**Antifungal Activity**

Isoalantolactone isolated from the methanol roots extract of \(\text{Inula racemosa}\) was evaluated for antifungal activity against the human pathogenic fungi \(\text{Aspergillus flavus}\), \(\text{Aspergillus niger}\), \(\text{Geotrichum candidum}\), \(\text{Candida tropicalis}\) and \(\text{Candida albicans}\). The tested compound inhibited the growth of \(\text{Aspergillus niger}\), \(\text{Aspergillus flavus}\), \(\text{Geotrichum candidum}\), \(\text{Candida albicans}\) and \(\text{Candida tropicalis}\) with MICs values 50, 50, 25 and 25 µg mL\(^{-1}\), respectively\(^4\).
Antibacterial Activity

Antibacterial activity of the ethanol and aqueous root extract of *Inula racemosa* was evaluated by disc diffusion method against *Escherichia coli* and *Staphylococcus aureus*. The aqueous extract of the plant exhibited significant antimicrobial activity for these two microorganisms tested, with MIC values of 6.25 mg/ml and 12.5 mg/ml, respectively, whereas ethanol extract also had potent activity against microorganisms, with MIC of 15.625 mg/ml.

Hepatoprotective Activity

Hepatoprotective and curative effect of hydroalcoholic extract of the roots of *Inula racemosa* against hepatic ischemic/reperfusion injury in rats was examined. The plant extract at the dose of 200 and 400 mg/kg produced significant hepatoprotection by decreasing the elevated levels of aspartate transaminase, alanine transaminase, alkaline phosphatase and lactate dehydrogenase. It had also been seen that *Inula racemosa* increased the free radicals scavenging activity in the early period of hepatic ischemia/reperfusion injury in rats. In vitro hepatoprotective activity of ethanol roots extract of *Inula racemosa* was evaluated for its effect on the Chang cell line (normal human liver cells) against carbon tetrachloride induced hepatotoxicity. The cells which are exposed only with toxicant CCl₄ showed 42% viability while the cells which were pretreated with extract at concentration of 600 μg/ml and 300 μg/ml showed an increase in percentage viability (78%) and the results were highly significant compared to CCl₄ intoxicated cells.

Hepatoprotective activity of isolated compound isoalantolactone was evaluated against CCl₄ (2.0 ml/kg b.w.) induced liver injury in male wistar rats, at a dose of 100 mg/kg b.w. Silymarin (10 mg kg⁻¹) was used as a standard drug. The degree of protection was measured using biochemical parameters such as serum glutamate oxaloacetate transaminase (SGOT), serum glutamate pyruvate transaminase (SGPT), alkaline phosphatase (ALP) and bilirubin. The tested compound decreased the levels of these enzymes in a significant manner, similar to silymarin treated animal group when compared with CCl₄ treated group.

Anti-Allergic Activity

Mast cell stabilizing activity of 90% ethanol root extracts of *Inula racemosa* was evaluated on degranulation of rat peritoneal mast cell induced by compound 48/80 and egg albumin. Effect of plant extract on egg albumin induced mast cell degranulation in rats at concentration of 5, 10, 20 and 40 μg/ml produced dose related inhibition of 18.85, 39.96, 58.97 and 71.65% respectively. Whereas, kitotifen (standard drug, 10 μg/ml) was found to inhibit degranulation to an extent of 78.22%. Effect of *Inula racemosa* extract on compound 48/80 induced mast cell degranulation in rats at same concentration showed reduction in degranulation to 20.36, 37.08, 59.52 and 41.28% respectively while standard drug kitotifen was found to inhibit degranulation to an extent of 77.52%.

“In another experiment, anti-allergic activity of alcohol extract of roots of *Inula racemosa*, was studied in experimental models of type-I hypersensitivity, viz. egg albumin induced passive cutaneous anaphylaxis (PCA) and mast cell degranulation in albino rats. The plant extract showed significant protection against egg albumin induced passive cutaneous anaphylaxis, both in case of single dose administration as well as with administration of extract for seven consecutive days.

The hydroalcoholic extract of the roots of *Inula racemosa* was found to have potent antihistaminic activity as revealed by blockade of histamine-induced contractions of isolated tracheal chain of guinea pig and histamine, pollen extracts of *Zea mace*, *Holopetalia*, and *Acacia arabica* guinea pigs. The beneficial effects of *Inula racemosa* in bronchial asthma appear to be due to its antihistaminic, anti-5-HT and anti-allergic properties.

Mosquito Larvicidal Activity

“Quinet al isolated 11, 13-dihydroisoalantolactone, macrophyllic lactone E, 5-α-epoxyalantolactone and epoxyisoalantolactone from the ethanol root extract of *Inula racemosa*. Mosquito larvicidal activity of all these isolated compounds was evaluated against the larvae of *Aedes albopictus* and *Asian tiger* mosquitoes. The tested compound 11, 13-dihydroisoalantolactone and macrophyllic lactone E exhibited strong larvicidal activity against the early fourth-instar larvae of *Aedes albopictus* with LC₅₀ values of 21.86 μg/mL and 18.65 μg/mL respectively, whereas 5-α-epoxyalantolactone and epoxyisoalantolactone also possessed larvicidal activity against the Asian tiger mosquitoes with LC₅₀ values of 29.37 μg/mL and 35.13 μg/mL respectively.

Antioxidant Activity

Antioxidant activity of 70% ethanol extract of the roots of *Inula racemosa* was performed in Albino rats. The effect of daily oral administration of alcoholic extract (suspended in 1% gum acacia) of the roots of *Inula racemosa* to rats for 21 days was investigated for lipid peroxide formation and reduced glutathione content. The level of GSH in blood and liver was found significantly higher in treated animals as compared to control (1% gum acacia). Result showed that *Inula racemosa* has antioxidant properties because greater availability of GSH to the cell would lead to higher rate of destruction of deleterious hydrogen peroxide and lipid peroxides by glutathione peroxidase.

Antiasthmatic Activity

The anti-asthmatic activity of the roots extracts of *Inula racemosa* was evaluated by measuring the antagonistic effect on histamine-induced contraction, milk induced eosinophilia, leukocytosis and protection against mast cell degranulation in wistar rats. Petroleum ether extract the plant at a dose of 4 mg/mL (55.41 ± 3.04) and 10 mg/mL (48.87 ± 1.36) exert significant antagonistic effect on histamine induced (1.6 μg/mL) contraction as compared to its ethanol and aqueous extract. Milk-induced eosinophilia in mice of petroleum ether extract at a dose of 50 & 100 mg/kg Intraperitoneal (i.p.) was found to be 44.77% and 54.36% respectively as compared control group (43.1 ± 2.41). Similarly, dose dependent inhibition of petroleum ether extract at a dose of 50 and 100 mg/kg, i.p. on milk induced leucocytosis (59.53% and 77.47%) supports the adaptogenic potential of the drug. Pretreatment with petroleum ether extract at a dose of 100 mg/kg, i.p. significantly offered protection (74.68%) against mast cell degranulation when compared with control group.

Antimutagenic and Antiapoptotic Effects

Protective effect of aqueous root extract of *Inula racemosa* was evaluated on 4-nitroquinoline-1-oxide -induced DNA damage and apoptosis in mice bone marrow cells. Aqueous root extract of *Inula racemosa* (100, 200 and 400 mg/kg, b.w.) with or
without treatment with 4-nitroquinoline-1-oxide (4-NQO) were administered orally for five consecutive days. Antiapoptotic effect of aqueous root extract of *I. racemosa* (400 mg kg⁻¹, b.w.) was measured by the use of Annexin V-FITC assay kit. 4-NQO-induced genetic damage in mice was modulated by aqueous root extract of *I. racemosa* via effective restoration of micronuclei and apoptotic cells formations. The potential protective effects might be due to the synergistic effects of secondary metabolites present in aqueous root extract of *I. racemosa*.

**Adaptogenic Activity**

Adaptogenicity potential of 90% ethanol roots extract of *I. racemosa* was investigated in the forced swim test model in albino mice. The animals treated with 100 mg kg⁻¹ and 200 mg kg⁻¹ of ethanol root extract of *I. racemosa* showed a significant decrease in the immobility period with simultaneous increase in antioxidant markers, adrenaline and serotonin levels.

**Adrenergic β-Receptor Blocking Activity**

“The adrenergic β-receptor blocking activity of the petroleum ether extract of the roots of *I. racemosa* was evaluated in rats. The plant extract showed lowered plasma insulin and glucose levels within 75 min of oral administration and it significantly neutralized adrenaline induced hyperglycaemia. Furthermore, the extract showed negative ionotropic and negative chronotropic effects on frog heart. These findings suggest that *I. racemosa* exhibited β-receptor blocking activity.

**Hypoglycemic Activity**

Endocrine response of ethanol roots extract of *I. racemosa* was evaluated in relation to glucose homeostasis in rats. It was found that alcoholic extract of the roots of *I. racemosa* lowers blood glucose level and enhances liver glycogen without increasing plasma insulin level in rats.

Anti-diabetic effect of *I. racemosa* roots powder was performed in 15 patients of age above 35 years suffered from the complications of diabetes mellitus like polyuria; polydypsia and polyphagia etc. were selected for the clinical study. All the patients were treated with 1 tablespoonful of *I. racemosa* roots powder three times in a day for three months duration. The response was estimated on the parameter of Joslin’s Clinica. After the treatment blood glucose level of all patients was found to be normal.

Roots of *I. racemosa* were evaluated for the amelioration of corticosteroid (dexamethasone) induced hyperglycaemia in mice. Corticosteroid administration in the animals increased the serum glucose level. Roots of *I. racemosa* decreased the serum concentrations of the thyroid hormones tetraiodothyronine (T₄) and triiodothyronine (T₃) in corticosteroid-induced hyperglycaemic mice which was found comparable with standard drug ketoconazole. Findings of the results suggest that hypoglycemic effect of the extract was mediated through its cortisol inhibiting potency. Ethanol extract of the roots of *I. racemosa* was evaluated for the effect on glucose metabolism in albino rats. Blood glucose, plasma insulin and liver glycogen levels were measured after 2, 4, 8, 16 and 24 hours of drug administration. At a dose of 400 mg kg⁻¹, b.w. plasma glucose level decreased after 4 hours of drug administration and returned to normal at 16 hours. Liver glycogen level was increased significantly as compared to control group at 4 hours after drug administration. A significant reduction in plasma insulin level was observed 4 hours after drug administration, and returned to normal at 8 hour, and remained low up to 16 hours.

Water decoction of the root of *I. racemosa* has been reported not only to lower the fasting blood glucose in normal rabbits, but also to protect the rabbit against glucose included hyperglycemia. Chronic treatment with methanol root extract of *I. racemosa* produced significant reduction in blood sugar level in alloxan-induced hyperglycemia model as compared to alloxan treated animals. The body weight, food intake, water intake and urine output were significantly reversed to normal by methanol extract of *I. racemosa* treatment.

**Cardioprotective Activity**

The cardioprotective potential of hydroalcohol extract of roots of *I. racemosa* was evaluated against isoproterenol-induced myocardial infarction in rats. The rats were treated with isoproterenol (85 mg kg⁻¹, subcutaneously) exhibited myocardial infarction, like decrease in arterial pressure, heart rate, contractility, relaxation along with increased left ventricular end diastolic pressure, as well as decreased endogenous myocardial enzymatic and non-enzymatic antioxidants. Isoproterenol also significantly induced lipid peroxidation and increased leakage of myocyte injury marker enzymes. Pretreatment with *I. racemosa* extract (100 and 200 mg kg⁻¹ per day, per oral) for 21 consecutive days, significantly restored the reduced form of glutathione and endogenous antioxidant enzymes superoxide dismutase, catalase, glutathione peroxidase from the heart, which were depleted after isoproterenol administration.

In another experiment it has been found that ethanol root extract of *I. racemosa* possess cardioprotective activity against isoproterenol induced myocardial infarction treated wistar rats by restoring electrocardiographic, histopathological and biochemical changes. Myocardial infarction was induced in the wistar rats by isoproterenol administration (200 mg kg⁻¹ subcutaneously twice at an interval of 24 h). Ethanol roots extract of *I. racemosa* markedly restrained isoproterenol-induced electrocardiographic changes indicative of its cell membrane protecting effects. At a dose of 400, 600 and 800 mg kg⁻¹ daily for a period of 10 days, it improved cardiac function, decreased oxidative stress, cardiac injury and maintained cell membrane integrity and lipid peroxidation process in a dose dependent manner. In addition, it has normalized histopathological changes caused by isoproterenol administration.

In another experiment myocardial ischemia was induced in rats by isoproterenol administration (20 mg 100 g⁻¹ subcutaneously twice at an interval of 24 h). The petroleum ether extract of roots of the plant *I. racemosa* and alantolactone, which have been isolated from the roots of the plant were subjected for evaluation of their cardioprotective activity in myocardial ischemia. Lipid peroxides and glutathione contents were anticipated. It has been found that the alantolactone as well as petroleum ether extract effectively reduces the lipid peroxide levels in the ischemic rats and brings the glutathione content to near normal level.

A combination of the plant *Commiphora mukul* and *I. racemosa* in 1:1 ratio was studied in 200 patients suffered with ischemic heart disease. The major symptoms included chest pain, with ST-segment and T-wave changes on the electrocardiogram (ECG), suggested myocardial ischemia in about 80 percent of the patients. Pretreatment with combination of the plant *Commiphora mukul* and *I. racemosa* in 1:1 ratio
to the patients caused improvement in precordial pain and dyspnea, restoration of normal ECG patterns, and significant reductions in cholesterol, triglycerides and total lipid levels 61.

The isolated compound from *Inula racemosa* was evaluated for the cardioprotective activity on isolated frog heart at a dose 40 

ng/ml.4 showed that alantolactone decreased heart rate and force of contraction. The study indicated that the alantolactone produces a negative inotropic and negative chronotropic effect on frog’s heart 64. Cardioprotective activity of ethanol root extract of *Inula racemosa* was also evaluated in wistar male albino rats having myocardial ischemic reperfusion injury. “The extract at a dose of 100 mgkg-1 for 30 days nicely restored the myocardial antioxidant status evidence by increased superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPO), reduced glutathione G1 and prevented leakage of cardiomyocytes specific enzymes, creatine phosphokinese isoenzyme and lactate dehydrogenase (LDH). The result suggested cardioprotective effect of *Inula racemosa* likely resulted to improve antioxidant status, haemodynamic and left ventricular contractile function subsequent to suppression of oxidative stress”60.

**DISCUSSION**

Many of the local and traditional claims for the use of different parts of *Inula racemosa* have been scientifically established by *in vivo* and *in vitro* techniques. Sesquiterpene lactones have received considerable attention because of their numerous biological activities 28. In addition, these compounds exert their allelopathic effects on other flora and vertebrate poisoning28. The plant is used in Ayurveda as an expectorant and resolvent in indurations. Considered a rejuvenator and immunomodulator by Ayurvedic physicians, the drug according to Bhavaprakasha 65 is bitter pungent in taste. When administered it mitigates Vatakapha Jwara (fever caused by vata pitta imbalance), sotha (swelling), aruchi (anorexia), swasa (breathlessness) and parswasoola (pain in the sides of the chest)7. The root of *Inula racemosa* is an important ingredient of several polyherbal formulations those are for cardiac disease and inflammatory conditions of spleen and liver. Besides compounds of *Inula racemosa* root and *Cominium mukul* called Pushkar Guggulu is a popular anti obesity, hypolipidemic is indicated in cardiac ailments.

The root is medicinal and considered a specific for cough, dyspnea, asthma, pleurisy, tuberculosis and myocardial ischemia and chest pain especially pre cordial pain. Root powder is reportedly hypoglycemic and hypocholesterolemic in human subjects 42. It brought about a beneficial improvement in ST-T changes in ECG of patients with Ischemic heart disease (IHD).

The aqueous extract of the fresh or dry roots is given orally in changes in ECG of patients with Ischemic heart disease (IHD). Subjective and objective parameters were evaluated in patients having hypertensive heart disease and IHD.

The aqueous extract of the fresh or dry roots is given orally in patients suffering from angina pectoris: a preliminary report. Indian journal of physiology and pharmacology 1983,28 (1), 73-75.
